

# Text Analytics (Part 1 only)

---

**Due** No Due Date      **Points** 0

---

In this assignment, we will use vector embeddings of terms to understand semantic relationships and perform machine learning.

This is Part 1 only: You will simply configure your environment to ensure you can successfully run the following Jupyter notebook:

[text\\_analytics\\_assignment\\_part1.ipynb](#)

You will need to configure a Python 3 environment to use the [gensim](https://pypi.python.org/pypi/gensim) library.

This step may be as simple as running

```
$ pip install gensim
```

I use [conda](https://conda.io/docs/intro.html) to manage python environments.

Once gensim is installed, step through the cells in the notebook, and take note of the instructions.

Once you get this notebook running, you are done with Part 1. There is nothing to turn in, but do complete this step early!
